Pressures and Densities

$$\text{Pressure} = \frac{\text{force}}{\text{area}}$$

1 column of water 1 foot deep = 62.4 pounds per square foot, or 0.433 pounds per square inch. 1 column of water 1 centimeter deep = 1 gram per square centimeter.

Specific gravity (liquid) = number of times a substance is as heavy as an equal body of water, or specific gravity (liquid) = $\frac{\text{weight of liquid}}{\text{weight of equal volume of water}}$

$$\text{Density} = \frac{\text{weight}}{\text{volume}}$$

Pressure = depth x density, or force per unit area. An increase in pressure is transmitted equally through the liquid.

Specific gravity (solid) = $\frac{\text{weight of body}}{\text{weight of equal volume of water}}$

or specific gravity (solid) = $\frac{\text{weight of body}}{\text{loss of weight in water}}$

One cubic yard of air weighs about 2 pounds. Atmospheric pressure at sea level = about 15 pounds per square inch.

Velocities and Energies

$$\text{Velocity} = \frac{\text{distance}}{\text{time}}$$

$$\text{Acceleration} = \frac{\text{change of velocity}}{\text{time}}$$

$$\text{Acceleration of gravity} = \frac{32 \text{ feet per second}}{\text{seconds}}$$

$$\text{Centripetal force} = \frac{\text{weight}}{\text{acceleration of gravity}} \times \frac{(\text{velocity})^2}{\text{radius}}$$

Potential energy = weight of body x elevation

$$\text{Kinetic energy} = \frac{1}{2} \frac{\text{weight}}{\text{acceleration of gravity}} \times (\text{velocity})^2 \text{ac}$$

Momentum = mass of body x its velocity

$$\text{Mass} = \frac{\text{weight}}{\text{acceleration of gravity}} \sqrt{\frac{\text{L}}{\text{G}}}$$

Period of pendulum: $T = 2\pi$

Wave velocity = wave frequency x wave length, or $v = nxl$

Speed of sound: 1090 feet per second in air at 0 degrees Celsius.

Velocity of sound increases 2 feet per second for each degree Celsius rise in temperature above zero degrees Celsius.

Electricity

1 ampere = 1 coulomb per second

1 volt = 1 joule per coulomb

Ohm's Law: Current = $\frac{\text{potential difference}}{\text{resistance}}$
or amperes (I) = $\frac{\text{volts or E}}{\text{ohms}} = \frac{\text{E}}{\text{R}}$

Ampere = electric current

Volt = potential difference

Ohm = electrical resistance

One volt potential difference will drive 1 ampere through a resistance of 1 ohm.

The resistance of conductor can be calculated by the formula:

$$R = \frac{kl}{d^2} \quad (\text{Where } l \text{ is length, } d \text{ is diameter, and } k \text{ is constant})$$

The combined resistance of conductors connected in parallel is

$$\frac{1}{R_c} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}$$

1 watt is the power of a current on 1 ampere when the potential difference is 1 volt.

To compute electric power: P (power in watts) = V (voltage in volts) x I (current in amperes), or $P = V \times I$.

To compute the heat (H), produced by a current (I), through a resistance (R), in a time (t), use the equation:
 $H = I^2 \times R \times t \times 0.24 \text{ cal/watt-sec.}$

Light and Lenses

1 foot-candle: the illumination of any point on a surface 1 foot from a standard candle.

$$\text{Illumination(ft-c)} = \frac{\text{intensity (candles)}}{\text{distance in feet}^2}$$

Velocity of light = 186,000 miles per sec.

$$\text{Index of refraction} = \frac{\text{velocity of light in air}}{\text{velocity of light in the substance}}$$

$$\text{Lens image equation: } \frac{1}{D_0} + \frac{1}{D_1 f} = \frac{1}{L}$$

$$\text{Magnification} = \frac{\text{image length}}{\text{object length}} \quad \text{or} \quad \frac{\text{image distance}}{\text{object distance}}$$

Conversions

Heat

To convert Fahrenheit to Celsius: subtract 32 from F, then multiply by $\frac{5}{9}$, written $C = \frac{5}{9}(F-32)$. NOTE: Centigrade is now referred to as Celsius. (NOTE: $212^{\circ}\text{F} = 100^{\circ}\text{C}$). To convert Celsius to Fahrenheit: multiply C by $\frac{9}{5}$, then add 32, written $F = \frac{9}{5}C + 32$.

To convert Celsius to Absolute or Kelvin scale: add 273 to C.

To convert Fahrenheit to Absolute or Kelvin scale: first convert F to C, then add 273.

Boyle's Law: $p_1 \times V_1 = p_2 \times V_2$ at constant temperature. Zero degrees Kelvin is the lowest possible temperature.

In Kelvin Absolute temperature scale: water boils at 373K, freezes at 273K.

$$\text{Charles' Law: } \frac{V_1}{V_2} = \frac{T_1}{T_2} \text{ at constant pressure}$$

Combination of Charles' and Boyle's Laws:

$$\frac{V_1 p_1}{T_1} = \frac{V_2 p_2}{T_2}$$

When heated through one degree Celsius, any gas expands $\frac{1}{273}$

of its volume at 0 degrees Celsius if the pressure remains constant. One BTU is the heat required to raise the temperature of 1 pound of water through 1 degree Fahrenheit.

One calorie: the heat required to raise the temperature of 1 gram of water through 1 degree Celsius.

Specific Heat: heat required to raise the temperature of a unit mass of that substance through 1 degree. If H is total heat and M is mass, $H = M \times s \times (t_2 - t_1)$.

Heat of melting or heat of fusion, L, is the quantity of heat needed to melt one unit weight of substance without changing its temperature, or $H = M \times L$.

0 calories of heat is required to melt 1 gram of ice without raising its temperature.

Boiling point of liquid: that temperature at which the vapor pressure is equal to the pressure above the liquid.

0.427 kilogram-meter (kg-m) = 1 calorie

$$\frac{\text{Work}}{\text{mechanical equivalent of heat}}$$

Horsepower

1 horsepower = 550 ft-lb sec

$$\text{Horsepower} = \frac{\text{force (lb)} \times \text{distance (ft)}}{550 \text{ ft-lb sec} \times \text{time (sec)}}$$

$$\text{Friction Constant} = \frac{\text{friction force}}{\text{weight}}$$

Work = force x distance moved

$$\text{Power} = \frac{\text{work}}{\text{time}}$$

1 watt = 10,200 gram-centimeters per sec.

1 kilowatt is 1000 watts

1 kilowatt is approximately 1 $\frac{1}{3}$ horsepower

Dyne is absolute metric unit of force. Erg is its unit of work.

1 Erg = force of 1 dyne acting through 1 centimeter

1 Joule = 10,000,000 ergs, or about $\frac{3}{4}$ foot pounds

The law of work when friction is neglected: effort force x effort distance = resistance force x resistance distance Mechanical advantage of a machine =

$$\frac{\text{resistance force}}{\text{effort force}}$$

When friction is zero, mechanical advantage of a machine: $\frac{\text{effort distance}}{\text{resistance distance}}$

Mechanical advantage of a lever = $\frac{\text{effort arm}}{\text{resistance arm}}$

Moment of force = force x lever arm
Frictionless mechanical advantage of an inclined plane

$$\text{plane} = \frac{\text{length}}{\text{height}}$$

Frictionless mechanical advantage of a wheel and axle: $\frac{\text{circumference of wheel}}{\text{circumference of axle}}$
